

Module 2 Project Rubric

PromptLab | Brownfield Challenge | AIE 500 - 10x Coding with AI

C1.1-C1.6 | All six criteria must be Met to complete C1.

Repair the inherited PromptLab backend and demonstrate that you understand the system and can verify AI-assisted changes.

Evidence to prepare

- Repository with all four defects repaired and PATCH /prompts/{id} implemented; passing behavior and regression checks.
- docs/SYSTEM_MODEL.md covering routes, data flow, storage, dependencies and the context strategy used at each stage.
- docs/prompt-log.md with at least two substantive iterations and the reasoning behind each change.
- docs/ai-verification-note.md documenting one real wrong AI output, your check and the correction, linked to the log.
- Accurate Google-style docstrings for changed or added functions and README setup steps tested on a clean clone.

MUST PASS: C1.4 - Every bug is fixed

A Not Yet on this requirement returns the submission without reviewing the remaining criteria in this module.

How grading works

Every criterion is **Met** or **Not Yet**. There are no points, percentages, weights or bonus credit. All criteria in a competency must be Met; nothing is averaged.

Three attempts are available per module evidence group. Returned submissions do not consume an attempt, but require a revision plan. Re-assessment covers Not Yet criteria and any evidence affected by the changes. Follow the Syllabus for policy and course instructions for submission timing.

Returned before assessment: Missing deliverables, failing provided tests, an application that does not run or committed secrets. Rotate exposed credentials before resubmitting. Work belonging to another person or reconstructed logs/history are referred for academic review.

Module 2 | Assessment criteria (1/2)

C1 - Codebase Comprehension & AI-Assisted Debugging

C1.1-C1.6 | All six criteria must be Met to complete C1.

Criterion	Where your evidence lives	What earns "Met"	Common mistakes
C1.1 Your system model is accurate	docs/SYSTEM_MODEL.md	Correctly identifies every route the app exposes, the request-to-storage-and-back data flow, the prompt/collection relationship, how the storage layer works, and every external dependency. Nothing in the document contradicts the code.	- Describing what the AI said the code does rather than what it does. - Missing a module or dependency. - Listing file names without explaining behaviour.
C1.2 You justify your context strategy	docs/SYSTEM_MODEL.md, context strategy section	States, for each stage of exploration, whether you used whole-repo or file-level context, with a reason based on the size or coupling of the code.	- Not stating which approach you used. - A reason that doesn't match your prompt log. - Whole-repo context throughout with no rationale.
C1.3 Your prompt log shows real iteration	docs/prompt-log.md	At least two iterations where you narrowed context, added a constraint, or restructured a prompt because the output wasn't good enough - with your reasoning recorded.	- One successful prompt and nothing else. - Prompts listed with no outputs or reasoning. - Rewording without changing context or constraints.

Evidence must be genuine. Retain prompts, outputs, decisions and observations as you work. Reconstructed prompt logs or commit history are referred for academic review. A plausible AI summary is not evidence that the system model is correct.

Module 2 | Assessment criteria (2/2)

C1 - Codebase Comprehension & AI-Assisted Debugging

C1.1-C1.6 | All six criteria must be Met to complete C1.

Criterion	Where your evidence lives	What earns "Met"	Common mistakes
C1.4 Every bug is fixed (MUST PASS)	Repository; pytest tests/ -v output	All 4 bugs fixed - 404 on missing prompt, updated_at set on PUT, newest-first sorting, orphaned prompts handled - and PATCH /prompts/{id} implemented with partial updates, timestamp update and 404 handling. All provided tests pass and nothing that worked before is broken.	- A bug still present. - Hiding a bug instead of fixing it, such as catching an exception and discarding it. - A fix that breaks something else. - PATCH implemented but requiring all fields.
C1.5 You caught the AI being wrong	docs/ai-verification-note.md, traceable to docs/prompt-log.md	At least one specific case of wrong AI output: what it produced, why it was wrong, how you spotted it, what you did instead. The case appears in your prompt log.	- General comments about AI limitations with no actual example. - An example that's just a syntax error your editor would have caught. - An example not traceable to the log.
C1.6 Your documentation is accurate	Docstrings on functions you modified; README run instructions	Every function you modified or added has a Google-style docstring whose Args, Returns and Raises match the implementation. README run steps work on a clean clone.	- Docstrings listing parameters that don't exist or omitting ones that do. - README steps that fail on a fresh machine. - Docstrings restating the function name as a sentence.

Run the checks for your actual project. A test run that collects no tests is not passing evidence. The current starter requires you to author behavior checks; any provided assessment tests must also pass. Preserve the published contract, including partial updates and collection relationships.

Source: PromptLab Grading Rubric v2.1. Original Modules 1-5 map to current Modules 2-6. Criterion standards are retained; module/tool references are updated. The Syllabus governs policy.
